

Enrollment to private schools is clustered in western parts of Monroe County, New York.

I used the data for enrollment to schools from <https://census.gov> and aggregated that to get data for private schools in Monroe, NY. I then joined that data with the NY tracts data. After which I performed the Global and Local Moran's I analysis. I was able to see a high z-score and from the map we can see that enrollment for private schools in western areas seem to be more clustered. It may be interesting to investigate what's the choice for people in other areas or are there some other reasons altogether for such results.
